

Case Study 1: “The Kathmandu Food Delivery Chaos”

Story

A new food delivery app called “**QuickBite KTM**” is launching in Kathmandu. But the system is very basic — it only prints order details for now.

One evening, multiple orders come in from different parts of the city like Thamel, Baneshwor, and Lalitpur. The company wants a simple Java program to simulate order slips.

Your Task

Create a Java program that stores and displays **3 customer food orders**.

Each order must include:

- Customer Name (String)
- Location (String)
- Food Item (String)
- Quantity (int)
- Price per Item (double)
- Is Delivered (boolean)

Extra Fun Rule

Each order should feel like a delivery slip printed by the system.

Expected Output Style

QUICKBITE KTM - ORDER SLIP

Customer: Aayush
Location: Thamel
Food Item: Momo
Quantity: 2
Price: 150.0
Total: 300.0
Delivered: true

Customer: Sita

Location: Baneshwor
Food Item: Chowmein
Quantity: 1
Price: 180.0
Total: 180.0
Delivered: false

Challenge Rules

- No loops allowed
 - No scanner input needed
 - Just variables + print statements
 - Manually calculate total = quantity × price
-

Case Study 2: “IIMS College Festival Budget Tracker”

Story

IIMS College is organizing a grand annual festival. The event coordinator is manually tracking expenses using a very simple Java program.

Your job is to simulate a **budget tracking system** that prints expense details.

Your Task

Create a Java program that stores:

- Event Name (String)
- Organizer Name (String)
- Number of Students Attending (int)
- Budget Allocated (double)
- Food Expense (double)
- Decoration Expense (double)
- Is Budget Sufficient (boolean)

Logic Rule

Calculate:

```
Total Expense = Food + Decoration
```

Then decide:

```
Budget Sufficient = true if Budget >= Total Expense
```

Expected Output Style

🍷 IIMS FESTIVAL BUDGET REPORT 🍷

```
Event: Annual Tech Fest  
Organizer: Data Science Club  
Students: 250
```

```
Budget: 50000.0  
Food Expense: 20000.0  
Decoration Expense: 15000.0
```

```
Total Expense: 35000.0  
Budget Sufficient: true
```

Challenge Rules

- Use proper data types (int, double, String, boolean)
 - No conditions required (just manually assign true/false)
 - No loops, no input
 - Focus on clean output formatting
-
