

Question 1.

You and your friends ordered pizza. The total bill came in and now everyone needs to pay their share — plus you want to check if it's evenly divisible before splitting.

Sample Output

Enter total bill: 1000

Enter number of people: 4

Each person pays: 250

Splits evenly: true

Question 2.

A gym offers a discount to members who are between 18 and 25 years old and have signed up for more than 6 months. Write a program that takes a member's age and membership duration, then prints whether they qualify for the discount.

Sample Output

Enter age: 22

Enter months: 8

Discount: true

Question 3.

Your friend from the US keeps sending you temperatures in Fahrenheit. Write a program that takes a temperature in Fahrenheit, converts it to Celsius $(F - 32) \times 5 / 9$, and also tells you whether you should bring a jacket (anything under 15°C).

SAMPLE OUTPUT

Enter temperature (F): 50
Celsius: 10.0
Bring a jacket: true

Question 4.

In a game, every 500 XP earns you a level. Write a program that takes a player's total XP and prints their current level, how far they are into the current level, and how much XP they still need to reach the next one.

SAMPLE OUTPUT

Enter total XP: 1340
Current level: 2
XP into current level: 340
XP needed to level up: 160
