

Question 1.

Scenario: You are building a simple billing system for "JavaBrew Café". A customer orders a coffee and a snack. Your program should calculate their total bill, add a 10% service charge, and display a friendly receipt.

YOUR TASKS

- Create a static method `calculateTotal(double item1, double item2)` that returns the sum of two prices.
- Create a static method `addServiceCharge(double total)` that adds 10% to the total and returns the new amount.
- In main, use `Scanner` to ask the user to enter the price of a coffee and a snack.
- Call both methods and print a neat receipt showing item prices, subtotal, and final total with service charge.

SAMPLE OUTPUT

Enter coffee price: 3.50

Enter snack price: 2.00

===== JavaBrew Café Receipt =====

Coffee: \$3.50

Snack: \$2.00

Subtotal: \$5.50

Service (10%): \$0.55

Total: \$6.05

=====

Question 2.

Scenario: "CodeLand" theme park has different ticket prices based on age. Children under 5 enter free, ages 5–12 pay \$8, ages 13–17 pay \$12, and adults (18+) pay \$20. Build a program that figures out the ticket category and price for a visitor.

YOUR TASKS

- Create a static method getCategory(int age) that returns a String: "Free", "Child", "Teen", or "Adult".
- Create a static method getPrice(int age) that returns the ticket price as a double based on age.
- In main, ask the user for the visitor's name and age using Scanner.
- Display a personalised message showing their category and the price they need to pay (or "You're our guest!" if free).

SAMPLE OUTPUT — Example 1 (adult)

Enter visitor name: Priya

Enter visitor age: 25

Welcome, Priya!

Category: Adult

Ticket price: \$20.00

SAMPLE OUTPUT — Example 2 (free entry)

Enter visitor name: Rohan

Enter visitor age: 3

Welcome, Rohan!

Category: Free

You're our guest! Enjoy the park!
